

Assembly recommendations - Solar Explorer Kit

General Notes

- It is recommended not to tighten the supplied individual parts (pins, rods, lamp, etc.) too tightly.
- They should be fixed well enough so that they do not slip, but still possible to loosen them again with little effort.

Assembling the Explorer Kit

- First, attach the mounting bracket to the module using the supplied star grip screws.
- Then mount the central pivot bolt for attaching the PV module onto the base plate. The supplied hex nut has a wrench size of 13. When tightening, you can hold the pivot bolt with pliers or an open-end wrench size SW6.

Thank you

Thank you very much for your purchase!

Please check your ordered set for completeness. If anything is missing, please contact us:
